Public Lecture Astrobiology: The Hunt for Alien Life

Dr Lewis Dartnell

Leicester University

Friday 12 June 2015

7.00pm Memorial Hall

'Astrobiology' is a brand new field of science, encompassing research into the origins and limits of life on our own planet, and where life might exist beyond the Earth. But what actually is 'life' and how did it emerge on our own world? What are the most extreme conditions terrestrial life can tolerate? And where in the cosmos might we reasonably expect to find ET? Dr. Lewis Dartnell will take the audience on a tour of the other planets and moons in our solar system which may harbour life, and even further afield to alien worlds we've discovered orbiting distant stars, to explore one of the greatest questions ever asked: are we alone?

Admission is free, but tickets are required. Light refreshments provided. Tickets available from stpetersyork.eventbrite.co.uk.
